Exercise 1

For the Brock and Mirman model, find the value of A in the policy function. Show that your value is correct.

For this case find an algebraic solution for the policy function $k_{t+1} = \Phi(k_t, z_t)$. Sources for hints are Stokey et al. (1989, exercise 2.2, p. 12) and Sargent (1987, exercise 1.1, p. 47).

0.1 Brock and Mirman's Model

Households solve the following dynamic program:

$$V(K_t, z_t) = max_{K_{t+1}} ln(e^{z_t} K_t^\alpha - K_{t+1}) + \beta E_t\{V(K_{t+1}, z_{t+1})\}$$

The associated Euler equaation is:

$$\frac{1}{e^{z_t} K_t^\alpha - K_{t+1}} = \beta E_t\{\frac{\alpha e^{z_{t+1}} K_{t+1}^{\alpha-1}}{e^{z_{t+1}} K_{t+1}^\alpha - K_{t+2}}\}$$

The law of motion for z is:

$$z_{t+1} = \rho z_t + \epsilon_t; \ \epsilon_t \approx i.i.d(0, \sigma^2)$$

Verify that the policy function is of the following form:

$$K_{t+1} = A e^{z_t} K_t^\alpha$$

In order to determine the policy function, we need to find the value of A as a function of the model's parameters. Lets expand the euler equations:

$$\frac{1}{e^{z_t} K_t^\alpha - K_{t+1}} = \beta E_t\{\frac{\alpha e^{z_{t+1}} K_{t+1}^{\alpha-1}}{e^{z_{t+1}} K_{t+1}^\alpha * (1 - A)}\}$$

$$\Longleftrightarrow \ \frac{1}{e^{z_t} K_t^\alpha - K_{t+1}} = \beta E_t\{\frac{\alpha K_{t+1}^{\alpha-1}}{K_{t+1}^\alpha * (1 - A)}\}$$

$$\Longleftrightarrow \ \frac{1}{e^{z_t} K_t^\alpha - K_{t+1}} = \beta E_t\{\frac{\alpha}{K_{t+1}(1 - A)}\}$$

$$\Longleftrightarrow \ \frac{1}{e^{z_t} K_t^\alpha - K_{t+1}} = \beta \frac{\alpha}{K_{t+1}(1 - A)}$$

$$\Longleftrightarrow \ 1 = \beta * \alpha \frac{e^{z_t} K_t^\alpha - K_{t+1}}{K_{t+1}(1 - A)}$$

$$\Longleftrightarrow \ A = \beta * \alpha$$
